

Jarren Bess

Associate Software Engineer, AI Automation
Kingsport, TN | 423-384-0940 | jarren.bess@gmail.com | github.com/jbb-codes | jarrenbess.dev

EDUCATION

Bachelor of Science in Web Development
Bellevue University
Expected graduation: Dec 2026
GPA: 4.0

May 2025 - Dec 2026

CERTIFICATIONS

The Modern Software Developer
Vizuara AI Labs

Mar 2026

- Completed bootcamp covering coding LLMs, AI development with coding agents, Model Context Protocol (MCP), AI testing and security practices, deployment with Amazon Web Services (AWS), and DevOps.

TECHNICAL SKILLS

- Programming Languages: JavaScript, TypeScript, Python, HTML, CSS, Lua
- Frameworks & Libraries: Angular, Node.js, Express, Next.js, React
- Databases & Storage: MongoDB, SQL, NoSQL
- Tools & Platforms: Git, GitHub, REST APIs, Agile Development, Model Context Protocol (MCP), CI/CD
- AI & Automation: Agentic AI, Claude Code, AI Agent Orchestration, Automation Workflows, LLM-Integrated Tooling

EXPERIENCE / PROJECTS

Paper to Colab
Personal Project

2026

Next.js, TypeScript, Anthropic Claude API

- Automated conversion of academic PDFs into runnable, 7-section Jupyter notebook tutorials via Anthropic's Claude API, publishing with one-click "Open in Colab" links.
- Hardened the LLM pipeline against adversarial paper content by pairing input sanitization (6 injection patterns) with post-generation code scanning (7 dangerous patterns) as a second, independent safety check.
- Closed off common web attack vectors, including XSS, clickjacking, cross-origin abuse, and API-quota abuse, with 6 browser security headers, restricted CORS, and rate-limited API routes (10 requests/60s/IP).
- Built the full-stack application end-to-end, owning both the LLM orchestration backend and the Next.js frontend for PDF uploads, notebook preview, and one-click publishing.

Expense Tracking System
Team Project

2026

MEAN Stack (MongoDB, Express, Angular, Node.js)

- Architected 14 RESTful API endpoints across expense, category, and authentication routes, integrating an Angular front end for creating, searching, managing, and exporting expense reports; tested core logic with Jest suites.
- Took initiative on team setup and coordination, standing up the shared repository, database, and environment configuration, assigning work via 12+ GitHub issues, and explaining root causes to teammates during code review.
- Collaborated with a 3-person team to deliver a greenfield expense-tracking web application on a shared MongoDB Atlas cluster.

MCP Weather Server
Personal Project

2026

Node.js, Model Context Protocol SDK

- Orchestrated an AI coding agent to build an MCP server exposing 2 tools (get_current_weather, 1-7 day get_forecast) with Zod-checked inputs, covering 8 preset cities, for AI agent consumption.
- Designed LLM tool-calling interfaces using agentic AI patterns, enabling autonomous weather queries from Claude Code and similar clients.
